AGENT-O Core relationships for engineering review

A modular ontology for representing, evaluating and governing health-oriented agent systems

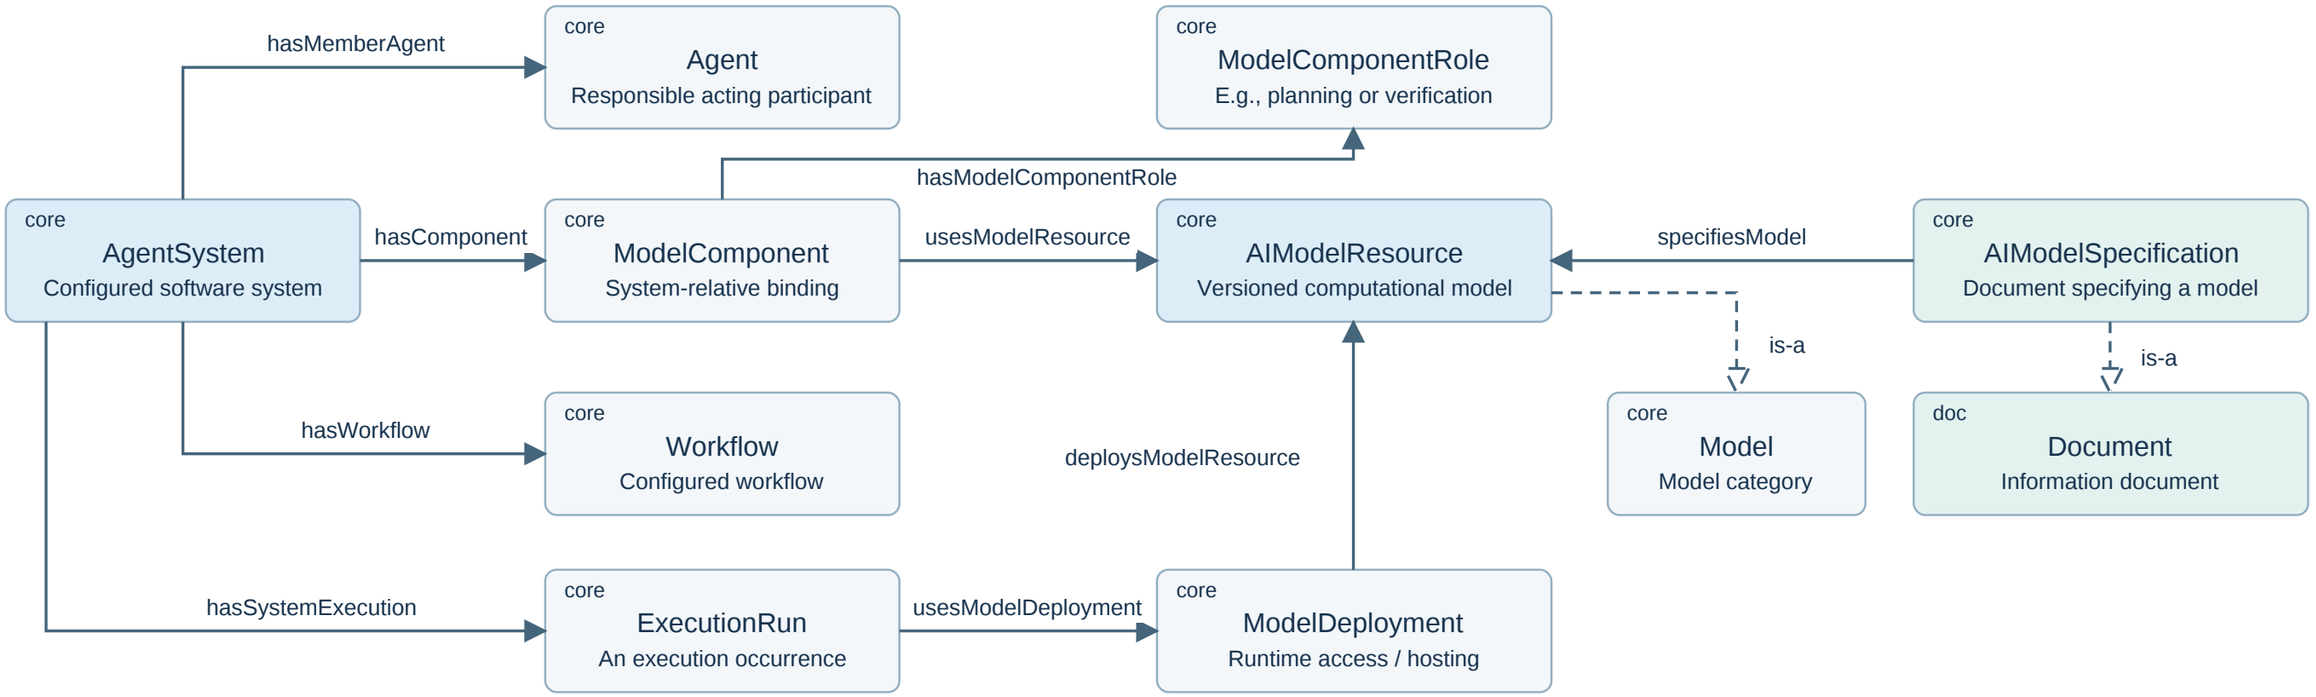

Object property: a link between instances

is-a: subclass to parent class

Selected schema view

A System, model and document identities

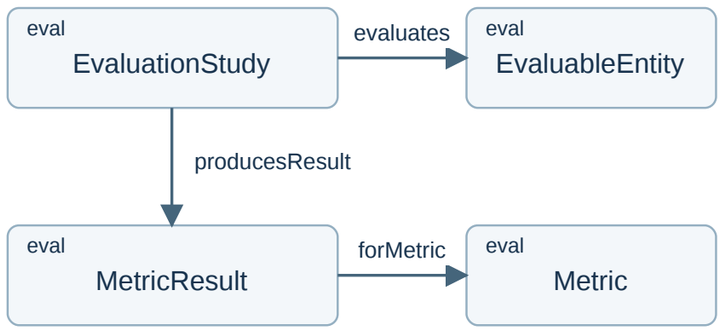

Namespaces: core + doc | Composition, functional roles, reusable model resources and runtime access

System membership does not imply agency. A configured system need not have past execution runs.

B Evaluation

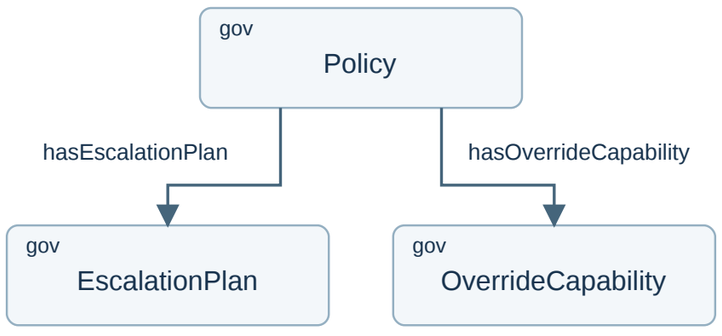

Namespace: eval | Study, target and result

Targets can include systems, models and workflows.

C Governance controls

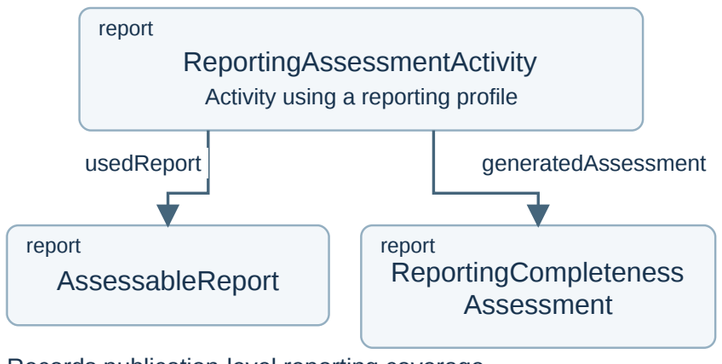

Namespace: gov | Prospective controls

Plans and capabilities are distinct from actual events.

D Reporting-completeness assessment

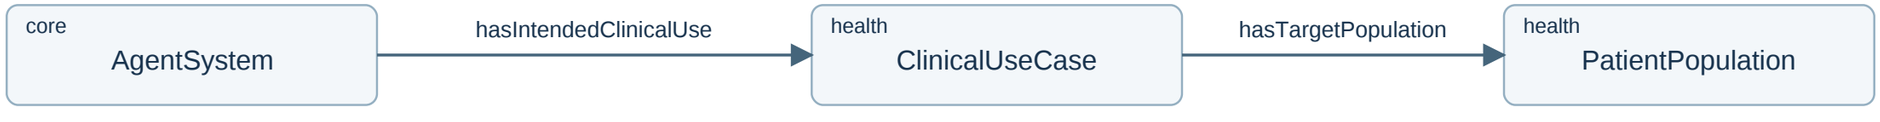

Namespace: report | Assessment of a publication

Records publication-level reporting coverage.

E Clinical context

Namespace: health

Reading guide: boxes denote classes. Solid arrows show selected links between instances; they do not impose universal existence or cardinality.
Repeated boxes denote the same class. Panel grouping is explanatory. This overview omits detailed classes, constraints and external alignments.

Prepared 2026-11-05 from the six current authoritative modules; includes the 2026-10-29 semantic revisions.
